SUMMARY

Product engineer who ships complete systems end-to-end, and builds the AI-agent infrastructure that lets AI-assisted teams ship safely: production LLM assistants, agentic development workflows, and review harnesses.

EXPERIENCE

Athena, Sole Engineer

Mar 2026 – Present

Business operating system for retail and service businesses, in production for Wigclub (Ghana)

- Built the full system as a TypeScript monorepo spanning point-of-sale, online storefront, inventory, payments, and service operations.
- Architected the POS local-first: the register runs against a local store so checkout never blocks on the network, with a sync layer that reconciles sales to the backend and preserves ordering across concurrent registers.
- Built an agent-ready delivery harness (generated repo maps, deterministic and LLM-based review lanes, runtime behavior scenarios recording structured evidence, and drift sensors) so AI agents ship changes with the same safety rails as a human team.
- Built the deployment pipeline: one-command deploys to a VPS behind Cloudflare Tunnel, automatic QA deploys on every merge, and instant rollback to any previous release.

Eventbrite, Senior Software Engineer

Mar 2022 – 2026 · Remote

Promoted SWE I → SWE II (2023) → Senior (2025)

- Technical lead and main implementer of Dashy, Eventbrite's AI-powered Event Dashboard Assistant (Amazon Bedrock). Owned it end-to-end: hardened chat BFF routes (auth, validation, rate limiting, streaming), lifecycle-grounded prompts and guardrails, and CSAT collection.
- Pioneered an agentic AI development workflow that scaffolds requirements, tickets, and code, cutting feature delivery from weeks to days; taught it at internal engineering forums.
- Core engineer on the migration of the legacy Event Dashboard to a modern Next.js stack: routing, permissions, analytics parity, and feature-flagged rollout with documented rollback. Built the error-recovery layer that eliminated 8+ second full-page reloads during backend failures.
- Led fraud prevention across subscription and checkout payment flows with Stripe Radar, cutting fraudulent payments 65% within three months; implemented 3D Secure/SCA verification, unblocking subscriptions for customers across the EU and India.
- Championed nonprofit plan automation beyond the team's roadmap, replacing an error-prone manual back-office process and auto-enrolling ~3,200 verified NPOs into discounted plans at launch.
- Built core Stripe billing services and infrastructure (Terraform-provisioned API Gateway with WAF, Lambda, DynamoDB, webhook processing, refund and proration endpoints), raising payment-service test coverage from 58% to 90%+.
- Shipped an onboarding flow that lets organizers start building an event before creating an account, lifting event creation +26.6%, event publishing +5.4%, and transactions +2.2%.

EARLIER EXPERIENCE

Apple, Software Engineering Intern (Jun – Nov 2021): migrated Java API test suites to Karate, cutting build and test times by 20%; expanded coverage of OS-services APIs by 40%+.

University of Maryland iSchool, Research Software Engineer (Dec 2019 – May 2021): built the UI of a teachable object recognizer helping blind users identify objects; co-authored papers presented at ACM ASSETS and CHI.

EDUCATION

B.Sc. Computer Science, University of Maryland, College Park

May 2021

SKILLS

Languages & frameworks: TypeScript, Python, React, Next.js, Node/Bun · **Cloud & infra:** AWS (Lambda, API Gateway, DynamoDB, CloudWatch), Terraform, Convex, PostgreSQL, Valkey/Redis, Cloudflare, CI/CD · **Payments:** Stripe, Radar, 3D Secure/SCA · **AI:** LLM assistants (Amazon Bedrock), agentic dev workflows, eval & review harnesses
